## Beskrivning

A new way to learn mechanical learning: AWS DeepLens offers sample projects that include hands-on examples that can be performed with a one-click and allows developers to start deep learning no matter what skill level is level. Custom-built for deep learning, AWS DeepLens is designed for deep learning. Over 100 GFLOPS device handling capabilities allow you to handle deep learning forecasts in real time. Build a custom model using Amazon SageMaker models that trained on Amazon SageMaker can be sent from the AWS Management Console in a few clicks to AWS DeepLens Supports a wide range of frameworks: AWS developers can perform a full range of deep learning framework, including TensorFlow and Caffe. AWS DeepLens has pre-installed injective engines optimized for performance, efficiency, and deep learning. This engine uses Apache MXNet. Integration with AWS AWS AWS DeepLens integrates with Amazon Rekognition for advanced image analysis, training models with Amazon SageMaker, and integrating with Amazon Polly to produce voice ready projects. Devices can also be securely connected to AWS IoT, Amazon SQS, Amazon SNS, Amazon S3, Amazon DynamoDB and more. Fully Programmable AWS DeepLens is easy to customize and is fully programmable using AWS Lambda. The DeepLens deep-learning model can also be executed as part of AWS Lambda functions. allowing you to experiment with a familiar program environment.

AWS Lambda functions, allowing you to experiment with a familiar program environment.
